General Description

SE85XX series is designed for power-sensitive applications. It includes a precision and high voltage input stage, an ultra-low-power bias current branch, and results in a ultra-low-power and low-dropout linear regulator.

The SE85XX operates from an input voltage of $V_{OUT}+1V$ to 35V, consumes only 2.5 μ A of quiescent current, and offers 1% initial accuracy and low dropout voltage, 300mV typical at 100mA.

SE85XX has 1.8V, 2.8V, 3.0V, 3.3V, 5.0V fixed voltage versions.

Other features include short-circuit protection and thermal shutdown.

Features

- Ultra Low Quiescent Current: 2.5 μ A(Typ.)
- Wide Operating Voltage: $V_{OUT}+1V$ to 35V
- High output current: $\geq 200mA$
- System startup with no overshoot
- Short circuit protection is designed with no overshoot
- UVLO 1.8V
- Low Dropout Voltage
- High Accuracy Output Voltage: $\pm 1\%$
- Excellent power / load transient response
- Low temperature coefficient: $\pm 100ppm/^{\circ}C$
- Thermal and Short-Circuit Protection
- SOT-89、SOT-23、SOT23-5 package
- Customer Pin Assignments are available

Applications

- Battery-powered Smoke sensor
- Smoke sensor
- Microcontrollers
- Household appliances and instruments

APPLICATION INFORMATION

INPUT CAPACITOR

An input ceramic capacitor of 1 μ F is required between the VIN and GND pin. The capacitor shall be placed as close as possible to VIN pin, and the wide copper trace is also recommended.

OUTPUT CAPACITOR

The recommended is 10 μ F ceramic capacitor. The minimum capacitance for stable and correct operation is 1 μ F. The higher the value of this output capacitor, the lower the ripple during the operations. The output capacitor should be placed as close to the Output Pin as possible. The wide copper trace is recommended.

NO-LOAD STABILITY

The SE85XX will remain stable and in regulation with no external load. This is especially important in CMOS RAM keep-alive applications.

FOLD-BACK SHORT-CIRCUIT PROTECTION

When short-circuit occurs, SE85XX will fold back the short-circuit currents to a pre-determined lower level, This will reduce excessive heat in otherwise large current conditions. This feature provides another level of protection to IC itself and also the whole system.

IN-RUSH CURRENT AND VOLTAGE

The following figure shows a typical application circuit for the SE85XX devices. Please keep in mind that in-rush current can push up the Vin overshoot by as much as 50%. For example, when Vin=30V, the in-rush caused spike voltage can be as high as 45V. Therefore the voltage rating of Cin needs to be higher than 50% of the application.

In live insertion application, it is suggested that R, C1 are selected as following:

1. C1=10 μ F ~ 100 μ F ceramic or electrolytic capacitor with maximum voltage greater than 50V, R=0
2. If the average current is known, for example a t 10mA, then for an input voltage of 20V, the C1 =1 μ F ~ 10 μ F ceramic or electrolytic with maximum voltage greater than 40V and R=1K Ω in the type of 1206 at 1/4W rating can be selected.
